Methods, devices, and systems for closing back door access mechanisms. A processor includes a first register configured to store one or more hardware-debug-test (HDT) enable bits, a first control logic coupled to receive a plurality of HDT input signals, and a second control logic coupled to the first register. The first control logic is coupled to access the first register. The second control logic is configured to store one or more default values in the first register in response to a reset of the processor. Another processor includes a first control logic coupled to receive a plurality of microcode inputs, a first register coupled to the first control logic, and a second control logic coupled to the first register. The first register is configured to store one or more microcode loader enable bits. The second control logic is configured to store one or more default values in the first register in response to a reset of the processor.

A method and system for providing an external locking mechanism for memory locations. The memory includes a first plurality of storage locations configured with BIOS data and a second plurality of storage locations. The second plurality of storage locations includes a first plurality of blocks readable only in SMM and a second plurality of blocks readable in SMM and at least one operating mode other than SMM. The computer system includes a bus, a memory coupled to the bus, and a device coupled to access the memory over the bus. The memory includes a plurality of storage locations, divided into a plurality of memory units. The device includes one or more locks configured to control access to one or more of the plurality of memory units.
